

Basic Python (With Explanation)

Objective:

To learn basic Python concepts such as variables, arithmetic operations, loops, and functions.

Program

```
In [2]: num1 = 12
num2 = 8

product = num1 * num2
print("Product:", product)

for number in range(1, 6):
    print("Count:", number)

def cube(n):
    return n ** 3

print("Cube of 3:", cube(3))
```

```
Product: 96
Count: 1
Count: 2
Count: 3
Count: 4
Count: 5
Cube of 3: 27
```

Result

The program was executed successfully in Google Colab. The experiment demonstrated the use of variables, arithmetic operations, loops, functions, and output display in Python.
